

# HTML short summary

Html allows us to specify what each part of a text is by using tags.

Tags look like this:

```
<tagName> Some Content </tagName>
```

For example:

```
<h1> My website </h1>
```

```
<li> This is a list tag </li>
```

```
<img src = "cat.png">
```

```
<a href = "www.google.com"> Click here to go to Google </a>
```

---

Every HTML document we create will start with this boilerplate:

```
<!DOCTYPE html>
<html>
<head>
  <title></title>
</head>
<body>
  <!--Content goes here!! This is also just a comment in html--!>
</body>
</html>
```

---

HTML forms is used to collect user input. Could look like this:

```
<h1>Sign In</h1>
<form>
<label>Username: <input type = "text"></label> <label>Password:
<input type = "password"></label>
<input type = "submit">
</form>
```

The code above will create this output in your browser:

**Sign In**

Username:  Password:
